SUMMARY

Business Analyst who builds what she specifies. Information Technology undergraduate (**GPA 3.40/4.0**, expected 2027) and team lead on consecutive projects. I own requirements end to end — defining actors and role-based access, mapping as-is / to-be workflows, translating business rules into system behaviour and wireframing in Figma — and then implement them in code.

I do not hand off at the spec. The **Firestore transaction** that makes double-booking impossible, and the **OCR + LLM extraction platform** behind my graduation thesis — a multi-tenant logistics SaaS I designed and built end to end — are my own code. Requirements I write are implementable because I am the one who implements them. Google-certified in **Project Management** and **UX Design**.

SKILLS & TOOLS

Business Analysis: Requirement Analysis, Actor & Role Definition, User Story Writing, Workflow Mapping (as-is / to-be), Functional Decomposition, Business-Rule Specification, Test Scenario Design

Product & Delivery: Figma (wireframing, user flows), Whimsical, User Research, Persona Definition, Agile/Scrum, Sprint Planning, Stakeholder Communication, Team Leadership (3–4 members)

Development & AI: Flutter/Dart, Firebase/Firestore (incl. transactions), SQL Server (queries, triggers, stored procedures), .NET MVC (C#), Python, REST APIs, Git/GitHub, OCR/LLM Document Pipelines, Prompt Engineering

PROJECTS

LogiUP — Logistics Document Automation Platform

Jul 2026 – Present

Business Analyst & Developer · Sole author · Graduation Thesis

Problem: Import/export teams manually re-key data from fragmented shipping documents into customs declarations and Certificate of Origin (C/O) forms — slow, repetitive, and error-prone at the point of transcription.

- Mapped the **as-is manual workflow** (document intake → manual reading → re-keying → cross-checking) and defined the **to-be flow**: OCR extracts fields, an LLM normalises them into a structured declaration payload, and a **human review checkpoint** is retained before submission.
- Analysed a multi-service logistics SaaS platform spanning **document ingestion, OCR/AI extraction, HS code assistance, declaration assembly, export workflows, tenant management and backoffice operations**; clarified system responsibilities across Portal, Platform, Engine and Backoffice.
- Identified roles and permission needs across **tenant users, logistics operators, backoffice admins and system administrators** for **RBAC** analysis; documented the business rules behind **multi-tenant routing, document status lifecycle, quota checks, audit logs and feature flags**.
- **Designed and built the platform single-handedly** — document ingestion, the OCR/LLM extraction pipeline, declaration assembly, the tenant portal and the backoffice — so every requirement I wrote was one I then had to make work.
- Wrote a Vietnamese **project overview and glossary** turning the technical architecture into BA-readable documentation for faster stakeholder onboarding.

Smart Medical Booking App

Feb 2026 – May 2026

Team Lead · Business Analyst & Core Developer · 4-member team

Problem: Appointment scheduling lacks real-time conflict prevention and is hard to use for elderly patients — causing double-bookings and low self-service adoption.

- Ran **user research** on the booking journey and turned the findings into **Figma wireframes and user flows** the team built from; surfaced voice interaction as an accessibility need, driving a **voice-assisted booking** feature.
- Defined **three actors** — **Patient, Doctor, Administrator** — each with a distinct permission scope and flow, settling access rules before implementation rather than patching them afterwards.
- Identified **double-booking** as the critical business rule (two patients must never hold the same slot), specified the rule, then **implemented** its enforcement as an atomic **Firestore Transaction** on the slot record.
- **Wrote the majority of the codebase** as core developer: the Flutter/Dart client against Firestore, role-based access for the three actors, the voice-assisted booking flow and Google Maps clinic search.
- Led the **4-member team** — decomposed features into sprint tasks and tracked delivery — then **authored and executed 100+ manual test scenarios** on physical devices to validate the booking, scheduling and permission flows.

Key Tech: Flutter · Dart · Firebase (Firestore, Auth) · Google Maps API · Figma

EDUCATION

Ho Chi Minh City University of Industry and Trade

Bachelor of Information Technology · GPA 3.40 / 4.0

Ho Chi Minh City, Vietnam

Expected 2027

- Consistently appointed as **team lead**; coordinated cross-functional delivery across analysis, design, development and QA.

CERTIFICATIONS & HONOURS

All Google Professional Certificates — Coursera, Apr–May 2026.

Project Management (cert) Agile and Waterfall lifecycles, planning, risk management, stakeholder communication.

UX Design (cert) User research, wireframing, prototyping, usability testing, Figma.

AI (cert) · AI Essentials (cert) · IT Automation with Python (cert) Applied AI, prompt engineering; Python, Git.

Scientific Research Competition, HUIT (Mar 2026) Co-authored a study on an AI-integrated social network for students; conceptualised the system architecture and designed the core user interactions.
